

KR-1 Krypton Calibration Light Source Installation and Operation Instructions

Description

The KR-1 Krypton Calibration Source is a wavelength calibration source for UV-VIS-Shortwave NIR spectrophotometric systems. The KR-1 produces Krypton lines from 427-893 nm, and is an ideal lamp to use when performing fast, accurate spectrometer wavelength calibrations.

The KR-1 features an SMA 905 Connector for interfacing with our optical fibers. It operates with a 12 VDC power supply (included with the unit) or 9V battery (not included).

The following sections detail the features of the KR-1 Krypton Calibration Light Sources.

KR-1 Krypton Calibration Light Source

Note

The KR-1 is NOT designed to operate as an excitation source in your experiments. Spectral lines above 922 nm are not easily detectable by Ocean Optics spectrometers.

Parts Included

The KR-1 package includes the following items:

- KR-1 Krypton Calibration Light Source
- 12 VDC power supply

WARNING

The beam emerging from the light source contains UV radiation that can cause serious eye injury upon direct contact with the eye. Never look directly into the light source.

The SMA 905 Connector may get extremely hot during operation. After lamp use, allow sufficient time to cool before handling.

Dangerous voltages are present, and there are no user-serviceable parts inside. Never open the KR-1.

Additional Accessories

The following are additional accessories available from Ocean Optics that you may need, depending on your system set-up:

- Spectrometer
- SMA-terminated optical fiber
- Ocean Optics software

Connecting the KR-1

Follow the steps below to set up your KR-1 for use.

► Procedure

1. Plug the 12 VDC power supply into a power outlet, then connect the barrel connector of the power supply to the power input on the rear of the KR-1.

or

Alternately, you can use a 9-volt battery (not included) to power the KR-1. Open the battery hatch of the KR-1 and install the 9-volt battery, and then proceed to Step 2.

2. Connect a fiber to the SMA 905 Connector on the KR-1. If your spectrometer does not have an entrance slit, use a 50 μm diameter (or smaller) fiber. Larger fibers and slits result in reduced optical resolution.

Note

If the spectrometer does not have a slit and your experiment requires you to use fibers of varying diameters, you will need to perform a wavelength calibration after changing fibers. You should perform a wavelength calibration each time you unscrew the fiber from the spectrometer and change fiber size.

3. Move the On/Off switch on the KR-1 (next to the SMA 905 Connector) to the On position. The red LED will illuminate to indicate that the KR-1 is powered on.

You have now configured the KR-1 for use.

Calibrating With the Light Source

The information in this section explains how to calibrate your spectrometer's wavelength using the KR-1 light source.

About the Wavelength Calibration

You are going to be solving the following equation, which shows that the relationship between pixel number and wavelength is a third-order polynomial.

$$\lambda_p = I + C_1 p + C_2 p^2 + C_3 p^3$$

Where λ = the wavelength of pixel p ,
 I = the wavelength of pixel 0,
 C_1 = the first coefficient (nm/pixel),
 C_2 = the second coefficient (nm/pixel²)
 C_3 = the third coefficient (nm/pixel³)

You will be calculating the value for I and the three C s.

Calibration Requirements for Ocean Optics Spectrometers

To re-calibrate the wavelength of your Ocean Optics spectrometer using the KR-1, you will need the following items:

- KR-1 Krypton Calibration Light Source
- Ocean Optics spectrometer and its manual
- An optical fiber (for spectrometers without a built-in slit, a 50- μ m fiber works best)
- A spreadsheet program (Excel or Quattro Pro, for example) or a calculator that performs third-order linear regressions

Note

If you are using Microsoft Excel, choose **Tools | Add-Ins** and check **AnalysisToolPak** and **AnalysisToolPak-VBA**.

Calibration Procedure

Please see the appropriate manual for your model Ocean Optics spectrometer for instructions on how to calibrate it. Ocean Optics manuals are located at <http://www.oceanoptics.com/technical/operatinginstructions.asp>.

KR-1 Specifications

The following sections detail the specifications of the KR-1.

Spectral Output

Strong KR Emission Lines by Wavelength (nm)

There are more emission lines shown below than printed on the label on the KR-1 housing. The label is intended as a quick, convenient reference and does not list every KR emission line that exists.

Below is a list of wavelengths for Krypton (as well as Neon and Xenon). Wavelengths listed in blue are the ones listed on the calibration lamp's label.

Wavelength	Lamp	Wavelength	Lamp	Wavelength	Lamp	Wavelength	Lamp
341.790	Ne	503.135	Ne	733.930	Xe	904.545	Xe

Specifications Table

Output	Low-pressure gas discharge lines of Krypton
Dimensions (in mm):	125.7 x 70 x 25.8
Power consumption:	250 mA at 12 VDC
Power requirements:	12 VDC wall transformer (included) or 9 VDC battery (optional)
Bulb life:	Approx. 3500 hours (at 20 mA)
Internal voltage:	600 volts at 30 kHz
Aperture:	3 mm
Amplitude stabilization:	~ 1 minute
Connector:	SMA 905
